

Dear MoveApps user,

over the last weeks we have improved functionalities mostly related to scheduled Workflows. [Scheduled workflows](#) are specially useful for tracking data with a live feed to Movebank. If you are only interested in the most recent data, you can select in the "Movebank location" App to only download the last n days of data. The results of your scheduled workflows can be sent to you by email and you can also embed them via [API link](#) to a website.

Latest improvements:

- Possibility to only receive emails when the scheduled Workflow run fails.
- Selection of the date and time of the first run of a scheduled Workflow is improved.
- The output overview has been adjusted to only show the relevant options when accessing it via the Workflow window or via the scheduled Workflow settings.
- The API link is now improved, and all current API links automatically will profit from this new feature:
 - The files obtained in the previous run are kept and made available via API until they get replaced by the newly calculated ones:
 - during the time the Workflow is re-running (scheduled or manually triggered)
 - when the settings of an App are modified
 - when the Workflow run fails
 - The files accessed via API link from the previous run will not be available anymore if:
 - an App is removed or added to the Workflow. This changes the position of the Apps and the API links are redefined.

It is still possible to apply for the open position, **deadline is the 14.03.2025**, [click here](#) to find all the details.

With kind regards,

Anne Scharf
